QuickReport

Empower your employees to report incidents in real-time on their mobile device using a simple QR code

HiveWatch

Giving a new meaning to the phrase, "See something, say something," now HiveWatch is helping to empower employees to report incidents directly from their mobile devices through the **QuickReport** feature in the **HiveWatch® GSOC Operating System (OS)**.

Easily download QR codes directly from the GSOC OS and place them throughout your facilities, allowing employees to report incidents they observe during their shifts. HiveWatch's incident submission portal enables users to report incidents efficiently, providing options to add detailed descriptions, attach media, and remain anonymous if desired.
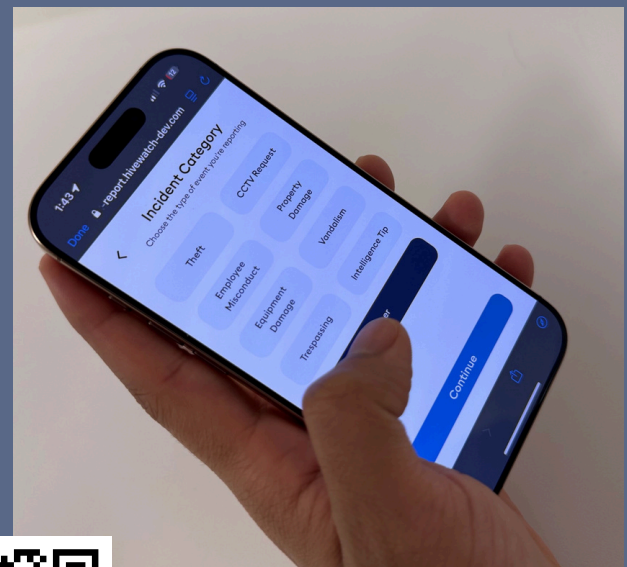

QuickReport helps security leaders:

- Gain more insights about the security of a facility through employee participation
- Filter incidents by location, reporting time, incident type, and more, allowing for efficient and timely incident triage
- Foster a culture of security and safety by empowering employees

How it Works:

- **Create QR codes through the GSOC OS,** and place them throughout your facility
- **When an employee sees an incident occurring,** they can scan the QR code and pull up a submission portal to provide info
- **Information that can be included:** personal information (optional), customized incident categories, detailed incident description, media attachments (such as photos / video)
- **Submitted incidents** are sent to the security operations center for operators to triage and respond to according to pre-established standard operating procedures (SOPs).
